                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   factor (VEGF) related protein) subunits that have at least one amino acid N-terminal to the first Cys of the core sequence deleted. Host cells transformed or transfected with expression vectors containing nucleic acids encoding the truncated VRP subunits are used to produce the truncated proteins recombinantly. The truncated VRP subunits, optionally expressed from gene therapy vectors, have in vivo and in vitro angiogenic activity and are used to stimulate angiogenesis, particularly coronary collateral vessel development in cases of cardiac ischaemia; to stimulate endothelial cell growth and migration in vitro; to treat heart disease; to treat ischaemia (e.g. cardiac, chronic coronary or chronic lower limb ischaemia; stroke and peripheral vascular disease); to promote healing of wounds (of skin or intestines), and to increase vascular permeability. Sequences AAW86222 to AAW86225 represent truncated fragments of VEGF-C.
                                                                                                                                                                                                                                                                                  VEGF; VRP; vascular endothelial growth factor; VEGF-related protein; recombinant; truncated; gene therapy; angiogenesis; cardiac ischaemia; coronary; collateral vessel development; cell growth; migration; heart; lower limb ischaemia; stroke; peripheral vascular disease; intestine; wound healing; skin; vascular permeability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human VEGF-C truncated fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New truncated vascular endothelial growth factor-related protein subunits - lack part of the N-terminal sequence, used to stimulate

Host CC cells transformed or transfected with expression vectors containing CC nucleic acids encoding the truncated VRP subunits are used to produce CC the truncated proteins recombinantly. The truncated VRP subunits, CC optionally expressed from gene therapy vectors, have in vivo and in vitro CC angiogenic activity and are used to stimulate angiogenesis, particularly CC coronary collateral vessel development in cases of cardiac ischaemia; to CC stimulate endothelial cell growth and migration in vitro; to treat heart CC disease; to treat ischaemia (e.g. cardiac, chronic coronary or chronic CC lower limb ischaemia; stroke and peripheral vascular disease); to promote CC healing of wounds (of skin or intestines), and to increase vascular CC permeability. Sequences AAW86222 to AAW86225 represent truncated XX

The truncated VRP subunits, optionally expressed from gene therapy vectors, have in vivo and in vitro angiogenic activity and are used to stimulate angiogenesis, particularly coronary collateral vessel development in cases of cardiac ischaemia; to stimulate endothelial cell growth and migration in vitro; to treat teart disease; to treat ischaemia (e.g. cardiac, chronic coronary or chronic lower limb ischaemia; stroke and peripheral vascular disease); to promote healing of wounds (of skin or intestines), and to increase vascular permeability. Sequences AAW86222 to AAW86225 represent truncated

Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39.7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). AAY08278-Y08301 are human growth factor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to truncated VRP (vascular endothelial growth CC factor (VEGF) related protein) subunits that have at least one amino CC acid N-terminal to the first Cys of the core sequence deleted. Host CC cells transformed or transfected with expression vectors containing CC nucleic acids encoding the truncated VRP subunits are used to produce CC the truncated proteins recombinantly. The truncated VRP subunits, CC optionally expressed from gene therapy vectors, have in vivo and in vitro CC angiogenic activity and are used to stimulate angiogenesis, particularly CC coronary collateral vessel development in cases of cardiac ischaemia; to CC simulate endothelial cell growth and migration in vitro; to treat heart CC lower limb ischaemia; stroke and peripheral vascular disease); to promote CC healing of wounds (of skin or intestines), and to increase vascular CC permeability. Sequences AAW86234 to AAW86239 represent full length VRP CC sequences from which the truncated fragments are created.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                  This polypeptide comprises a human foetal liver kinase 1 binding protein (flk lbp) (see AAW1837) that binds to the receptor tyrosine kinase flk1 expressed on vascular endothelial and other cells. The mature flk1-bp can be secreted from host cells transformed with an expression vector including an isolated flk-lbp cDNA clone (see AAT68811). Flk-lbp can be used to isolate cells to which it binds, for use in studying the roles of such cells and of flk-l in vasculogenesis and angiogenesis. Angiogenesis inhibition or increased vascularisation may be clinically desirable (e.g. to suppress solid tumour growth or in wound healing, respectively). The flk-lbp can be administered to treat conditions with defective or insufficient flk-l. Polypeptides may also act as carriers to deliver diagnostic/therapeutic agents to cells to which flk1-bp binds, to generate antibodies, and to identify flk-lbp antagonists

     This polypeptide comprises the pre-pro sequence of human VEGF-C, a novel ligand that binds specifically to human Flt4 receptor tyrosine kinase (VEGFR-3), stimulating phosphorylation of the receptor. Its sequence was deduced from a cDNA clone (AAT84276) obtd. from a PC-3 prostatic adenocarcinoma cell (ATCC CRL 1435)
                                                                                           Flt4 receptor tyrosine kinase ligand and related nucleic acid to modulate growth of endothelial cells and for diagnosis of endothelial cell diseases
                                                                       Claim 7;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A human vascular endothelial growth factor (VEGF)-related protein (VRP) (ARMI383) has been identified that binds to, and stimulates the phosphorylation of, the receptor tyrosine kinase FI14. It is postulated to be a third member of the VEGF protein family. Its amino acid sequence was deduced from a cDNA clone (ART59229) obtd. from a glioma G61 library. Recombinant VRF can be produced in transformed host cells and used: to promote growth of vascular and lymph endothelial cells; to stimulate phosphorylation of the tyrosine kinase domain of a FI14 receptor; as a diagnostic; as an additive to cell cultures; to screen for (ant)agonists: and to raise monoclonal antibodies used to treat conditions associated with excessive neovascularisation or vascular permeability. VRP may make it possible to avoid coronary by-pass surgery by stimulating growth of the collateral circulation.

The products can be used for stimulating angiogenesis, for inhibiting angiogenesis, for stimulating lymphangiogenesis, treatment or prevention of inflammation, oedemma, elephantiasis, or Milroy's disease. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used for middlate lymphocyte production and maturation, and to promote or inhibit trafficking of leucocytes between tissues and lymphatic vessels or to affect migration in and out of the thymus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The vascular endothelial growth factor C (VEGF-C) polypeptides have activities affecting growth and migration of vascular endothelial cells, promoting growth of lymphatic endothelial cells and lymphatic vessels, increasing vascular permeability, and affecting myelopoiesis. The products can be used for stimulating angiogeneses, for inhibiting angiogenesis, for stimulating lymphangiogenesis, treatment or prevention of inflammation, oedema, elephantiasis, or Milroy's disease. They can also be used to modulate myelopoiesis, e.g. treating granulocytopenia.
VEGF; VRP; vascular endothelial growth factor; VEGF-related protein; recombinant; truncated; gene therapy; anglogenesis; cardiac ischaemia; coronary; collateral vessel development; cell growth; migration; heart; lower limb ischaemia; stroke; peripheral vascular disease; intestine; wound healing; skin; vascular permeability.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           211
                                                                                                                                                                                                                                 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      y can also be used for modulating the growth of endothelial cells.
y can also be used to stimulate lymphocyte production and maturation,
to promote or inhibit trafficking of leucocytes between tissues and
phatic vessels or to affect migration in and out of the thymus.

The truncated VRP subunits, optionally expressed from gene therapy vectors, have in vivo and in vitro angiogenic activity and are used to stimulate angiogenesis, particularly coronary collateral vessel development in cases of cardiac ischaemia; to stimulate endothelial cell growth and migration in vitro; to treat heart disease; to treat ischaemia (e.g.cardiac, chronic coronary or chronic lower limb ischaemia; stroke and peripheral vascular disease); to promote healing of wounds (of skin or intestines), and to increase vascular permeability.
Human VEGC protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This represents the amino acid sequence of human vascular endothelial growth factor (VEGF)-C protein. The invention provides truncated VRF (VEGF-related protein) subunits that have at least one amino acid N-terminal to the first Cys of the core sequence deleted. Host cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              angiogenesis, e.g. for treating heart disease and ischaemia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel vascular endothelial growth factor X CC (PEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has CC vulnerary, cytostatic, antirheumatic, antiatritritic, antipsoriatic and CC antidiabetic activity and acts as an angiogenesis and vascularization CC regulator. An antisense molecule of the invention is useful for treating CC or preventing cancer, rheumatoid arthritis, psoriasis and diabetic certinopathy by inhibiting angiogenic activity or inappropriate CC vascularization including formation and proliferation of new blood concerts, growth and development of tissues, tissue regeneration and organ CC and tissue repair in a subject. The products of the invention are useful CC for preparing medicaments for treating wounds such as dermal ulcers, comparing treating treating wounds such as dermal ulcers, comparing treating treat

                                                                                                                                                                                                                                                                                                           The present sequence is the protein sequence for the human vascular endothelial growth factor C (PEGF-C). It was used to demonstrate the methods of the invention, which involve the screening of individuals to determine which vascular endothelial growth factor receptor 3 (VEGFR-3, also known as Flt4 or fms-like tyrosine kinase 4) alleles they possess and thus their likelihood of developing hareditary lymphoedema. Conditions associated with lymphoedema include Milroy-Nonne syndrome, which is early onset lymphoedema and lymphoedema praecox, which is late

The patent discloses a method to treat neoplastic disease characterised by expression of fms-like tyrosine kinase 4 (Flt4) receptor (also referred as vascular endothelial growth factor receptor-3, VEGFR-3) in endothelial cells of blood vessels adjacent to malignant neoplasm. The method involves administering a compound that inhibits binding of a ligand to Flt4 thereby inhibiting Flt4 mediated proliferation of vascular endothelial cells. The compound is useful for treating neoplastic disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; receptor tyrosine kinase; RTK; Flt4; fms-like tyrosine kinase 4; VEGFR-3; vascular endothelial growth factor receptor-3; chromosome 5q35; cytostatic; tumour imaging; anti-tumour therapy; treatment; diagnosis; neoplastic disease; lymphoma; carcinoma; breast; squamous cell; melanoma; sarcoma; malignancy; VEGF-C; vascular endothelial growth factor C.

                                                                                                                                                                                                                                                                                                                                                                        for manufacturing medicament useful for diagnostic screening, imaging and treatment of malignancies characterised by Flt4-expressing blood cells. The Flt4 gene maps to chromosomal region 5q35 and is expressed as 5.8 kb and 4.5 kb mRNAs which differ in their 3' sequences and are differentially expressed in HEL and DAMI cell lines. Flt4 belongs to a subfamily of class III receptor tyrosine kinases (RTKs). It is used as a target for tumour imaging and anti-tumour therapy: The present sequence is a human prepro-vascular endothelial growth factor C (VEGF-C), a specific example of Flt4 binding compound.
                                                                                                                                                                                                                                                                                                                                               Sequence
